

SEP 34: Wallet Verify Request For Anchors (created 17/8/2020)

- This protocol defines how anchors can cryptographically attribute HTTPS requests to wallet applications.
- Reconfirms every transaction, especially deposit/ withdrawal, must be authenticated. IP address + biometrics in KYCAML file
- Reverse Lookup: A server would perform a reverse lookup using the Stellar address as the username to ensure the returned address is valid.
- API Key Solution: Anchors would provide wallets with an API key for making requests to their server, preventing bad actors from impersonating other wallets.
