

WHAT IS XELMO

Xelmo is a groundbreaking hybrid cryptocurrency that combines the features of Stellar (XLM) and Monero (XMR) to create a secure and efficient platform for financial transactions

XELMO ??????? Monero's enhanced privacy, security, anonymity with Stellar's Guardian Overwatch (Quantum Stellar Nodes). As a separate blockchain, Xelmo functions as a living sandbox for testing and deploying new security features on its own mainnet (where all functionality is also fully compatible with Stellar) before they are approved and incorporated into Stellar mainnet as a future security upgrade

Key features include:

?Privacy-First Transactions: Ensures complete anonymity in financial dealings.

?Fast and Scalable: Utilizes Stellar's Consensus Protocol for quick and cost-effective transactions.

?Decentralized Exchange Integration: Allows secure and anonymous trading of Xelmo tokens on decentralized exchanges.

?Cross-Platform Compatibility: Accessible across various devices and platforms.

Project goals focus on enhancing privacy and security, improving accessibility and usability for users, and fostering community engagement for ongoing development and support.

The ultimate aim is to transition from a private network to a public platform accessible to all users.

?Quote from BunBun about XELMO stables

Both cbdc and xelmo stables are equally important for our future. Cbdc for bringing in the liquidity. Xelmo stables for internal security and operations.
